MALAT1 and NEAT1: two cancer-associated lncRNAs

The Long Noncoding RNA Malat1: Its Physiological and Pathophysiological Functions

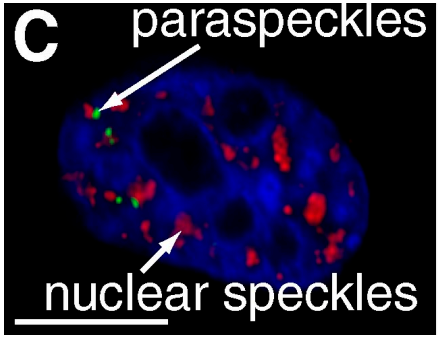
Xuejing Zhang, Milton H. Hamblin & Ke-Jie Yin

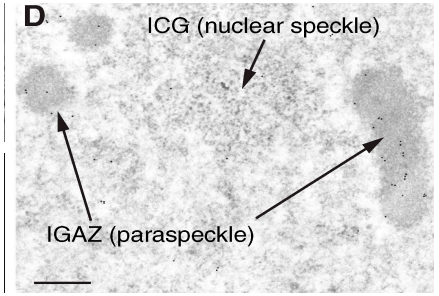
Biomed Pharmacother. 2017 Nov;95:822-828. doi: 10.1016/j.biopha.2017.09.005. Epub 2017 Sep 12.

Long non-coding RNA MALAT1 promotes proliferation and invasion via targeting miR-129-5p in triple-negative breast cancer.

Zuo Y[1], Li Y[2], Zhou Z[2], Ma M[2], Fu K[2].

MALAT1 **Localized to nuclear speckles**





Upregulated in many human malignancies including lung cancer, bladder cancer, breast cancer, colorectal cancer, esophageal cancer, gastric cancer, hepatocellular carcinoma, melanoma, neuroblastoma, ovarian cancer, prostate cancer and renal cell carcinoma

MALAT1 knockdown significantly inhibits cell motility in vitro and significantly limits metastasis formation in mouse cancer models

NEAT1-containing paraspeckles: Central hubs in stress response and tumor formation

Carmen Adriaens[a,b] and Jean-Christophe Marine[a,b]

[a]Laboratory for Molecular Cancer Biology, Center for the Biology of Disease, VIB, Leuven, Belgium; [b]Laboratory for Molecular Cancer Biology, Center for Human Genetics, KULeuven, Leuven, Belgium

NEAT1 **Scaffold for nuclear paraspeckles**

Upregulated in many human malignancies, including lung, esophageal and gastric cancers but downregulated in acute promyelocytic leukaemia

NEAT1 knockdown significantly suppressed cell proliferation and increased apoptosis in laryngeal squamous cell carcinoma, breast cancer and many other cell line

In colorectal cancer functionally, knockdown of NEAT1-1 decreased cell proliferation and invasion in vitro. Furthermore, high expression of NEAT1-1 was associated with poorer overall survival

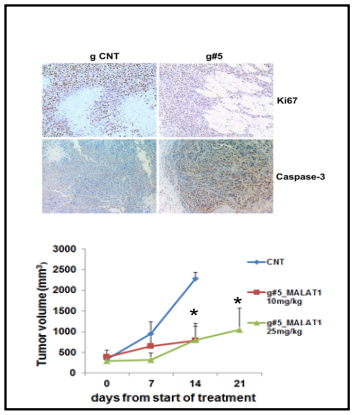
Leukemia

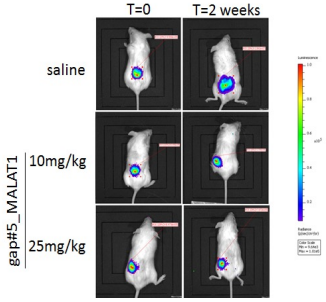
Leukemia. 2018 Feb 22. doi: 10.1038/s41375-018-0067-3. [Epub ahead of print]

Drugging the lncRNA MALAT1 via LNA gapmeR ASO inhibits gene expression of proteasome subunits and triggers anti-multiple myeloma activity.

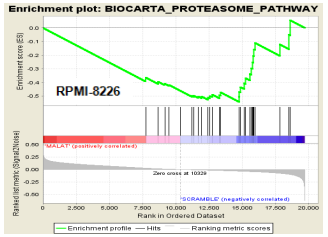
Amodio N[1], Stamato MA[1], Juli G[1], Morelli E[1], Fulciniti M[2], Manzoni M[3,4], Taiana E[3,4], Agnelli L[3,4], Cantafio MEG[1], Romeo E[1], Raimondi L[5], Caracciolo D[1], Zuccalà V[6], Rossi M[1], Neri A[3,4], Munshi NC[2,7], Tagliaferri P[1], Tassone P[8,9].

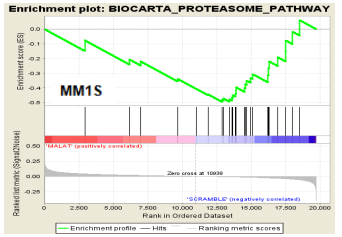
Strong antiproliferative effect of MALAT1 silencing by gymnotic Gapmer delivery in myeloma cells in vitro and in vivo



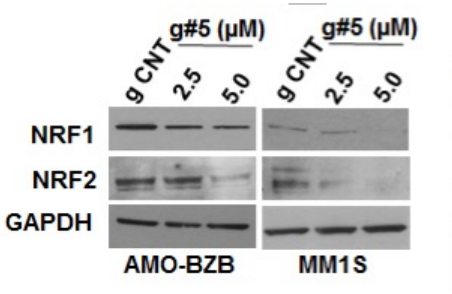


MALAT-1 depletion reduces proteasome gene expression in MM cells in vitro

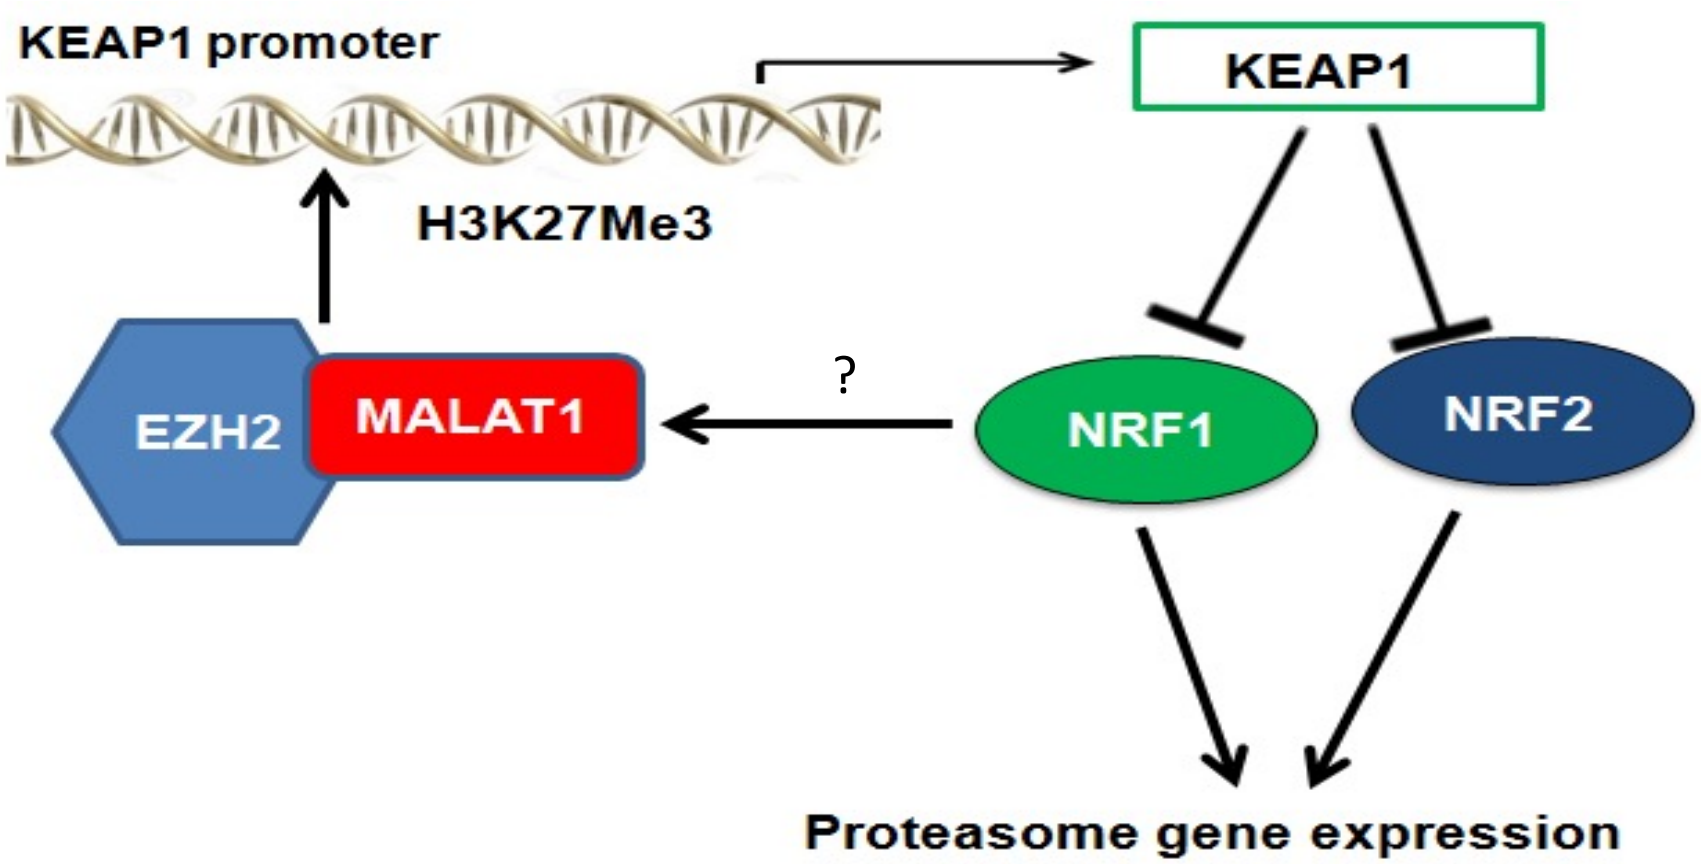




MALAT-1 silencing induces down regulation of transcription factors involved in proteasome gene activation

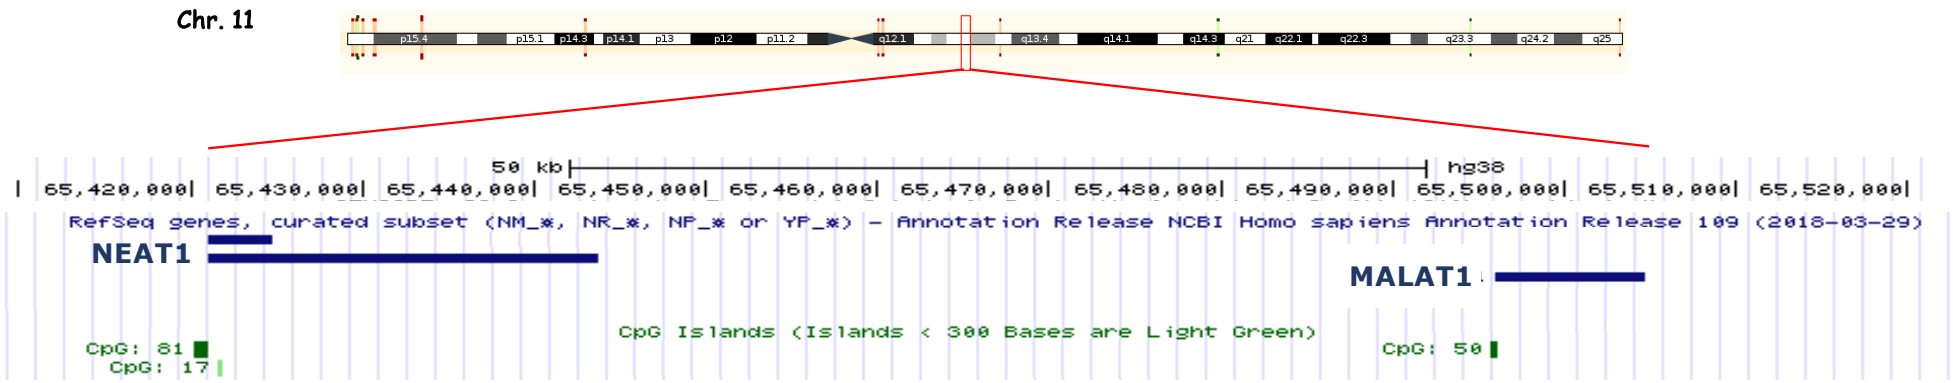


MALAT1 inhibition may target the proteasome in MM cells
by upregulating KEAP1 which in turn negatively regulates NFR2 and NFR2



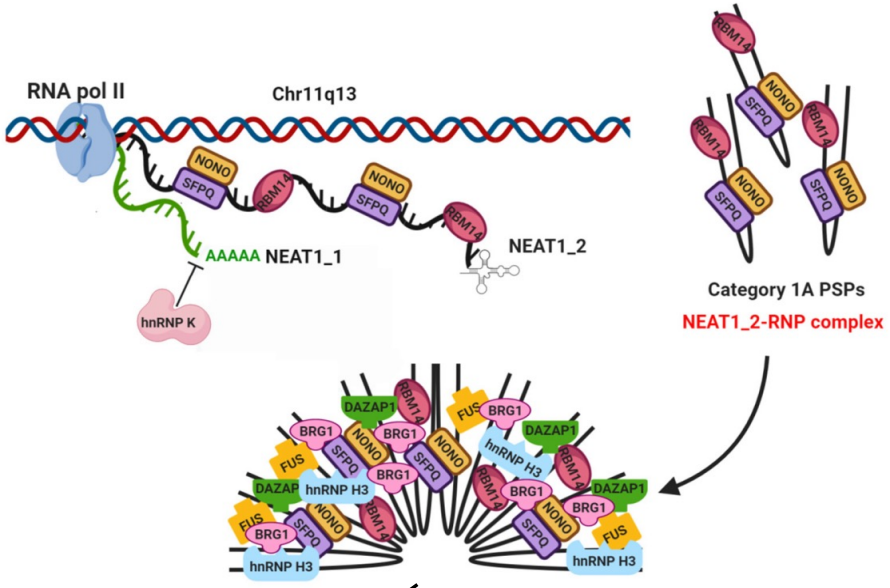
Amodio et al. Leukemia, 2018

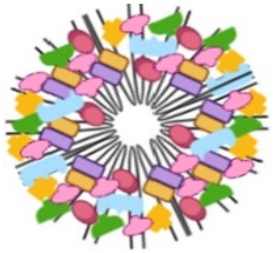
NEAT1



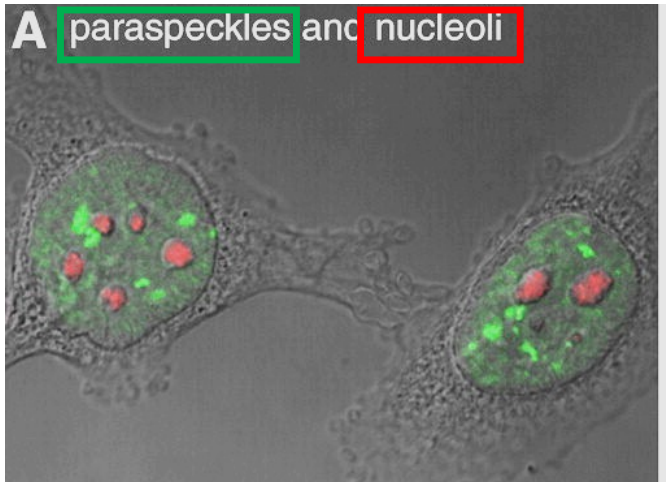
- architectural lncRNA
- located on chromosome 11
- abundantly express
- nuclear localization
- encodes for 2 different transcript variants (both single exon, 3.7 Kb and 23 Kb)
- **the long NEAT1 variant (NEAT1_2) represents the essential architectural component of paraspeckle nuclear bodies**

Paraspeckles





Paraspeckle



- **Paraspeckles (PSs)** are a class of dynamic subnuclear bodies found in the interchromatin space of mammalian cells.
- They are RNA-protein structures formed by the interaction between **NEAT1** and **essential proteins**: **NONO, SFPQ and FUS**. It is shown that more than 60 different RNA-binding proteins and TFs are in PSs.
- **PSs** control gene expression through the dynamic sequestration/release of proteins directly involved in transcriptional/translational activities
- Strongly involved in **cellular stress response**.

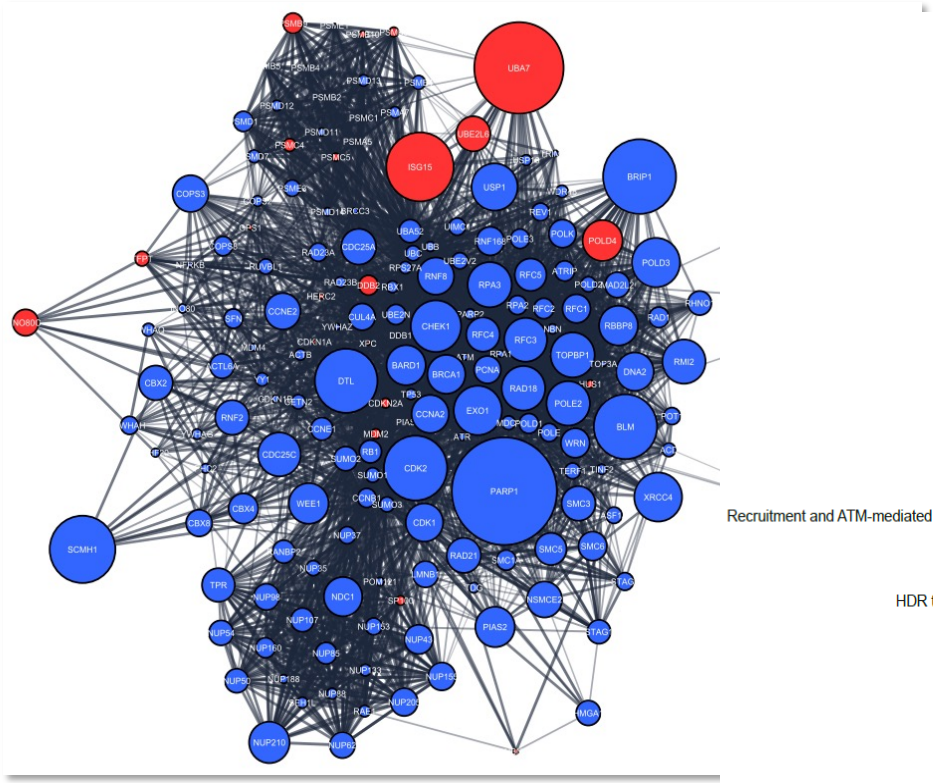
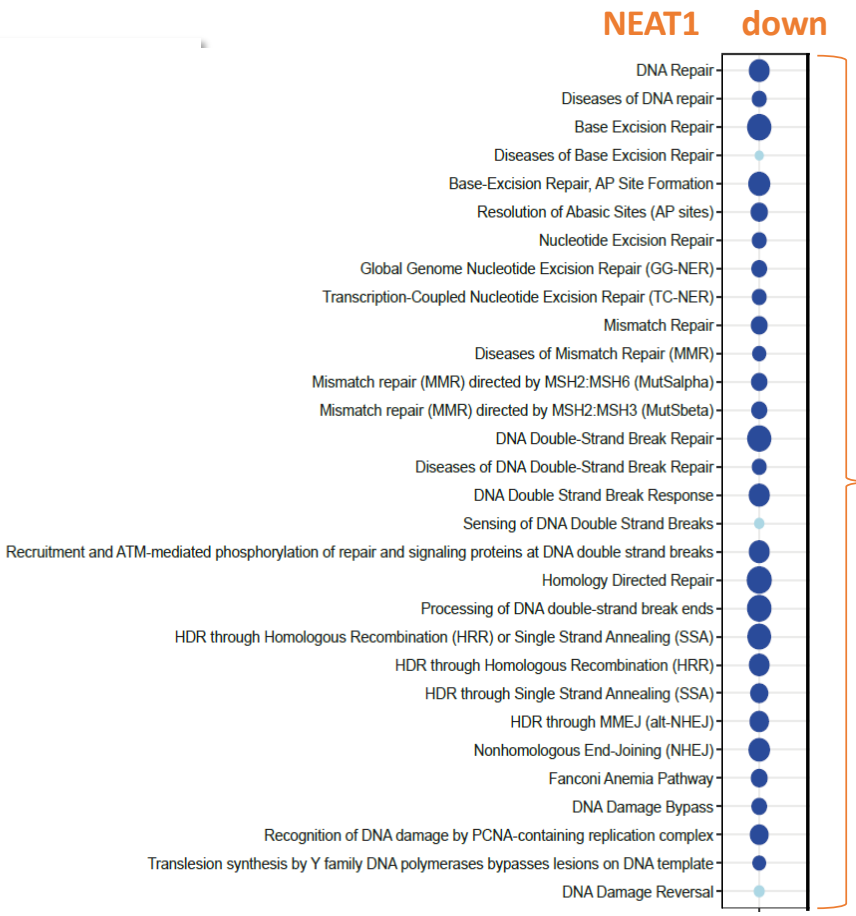
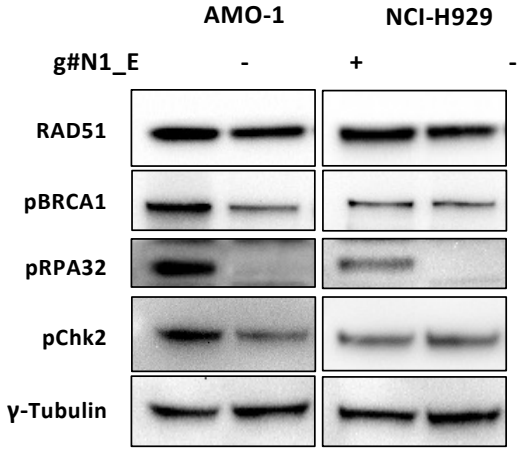
Taiana, E., et al. (2020). Leukemia

NEAT1 KD transcriptomic signature reveals an impairment of DNA repair processes



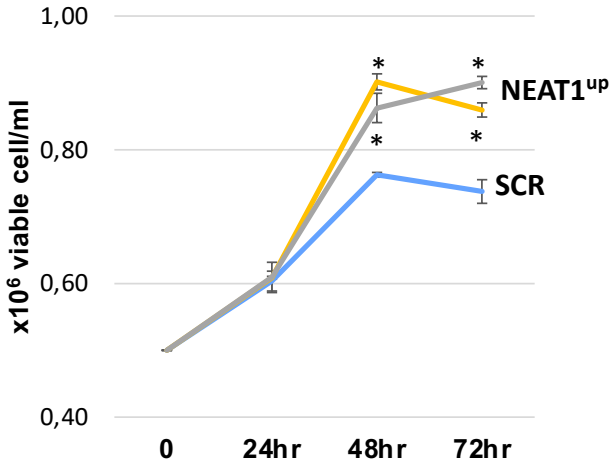


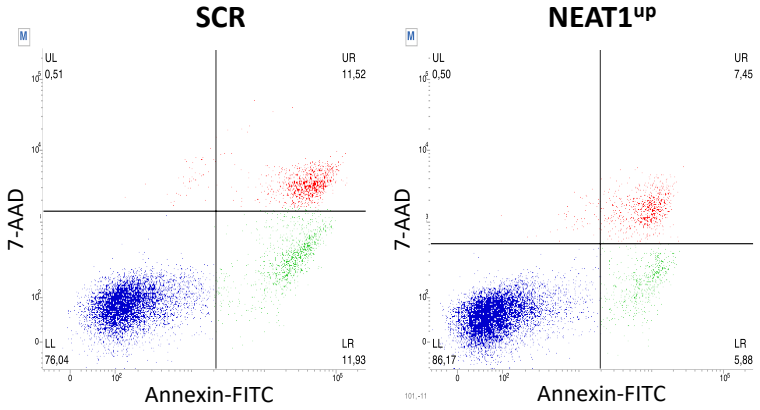


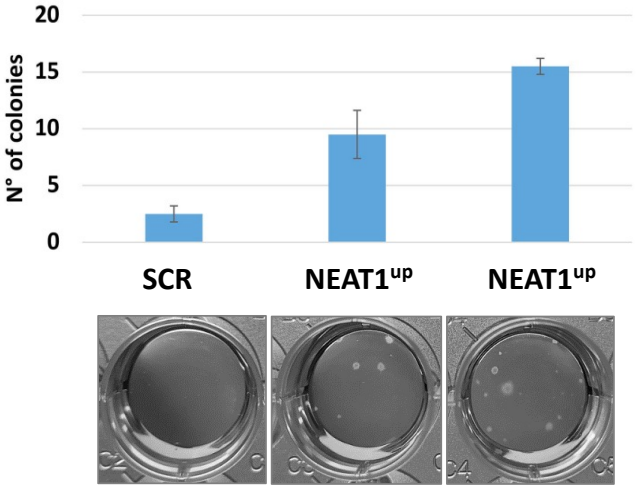
Taiana E. et al Leukemia, 2020

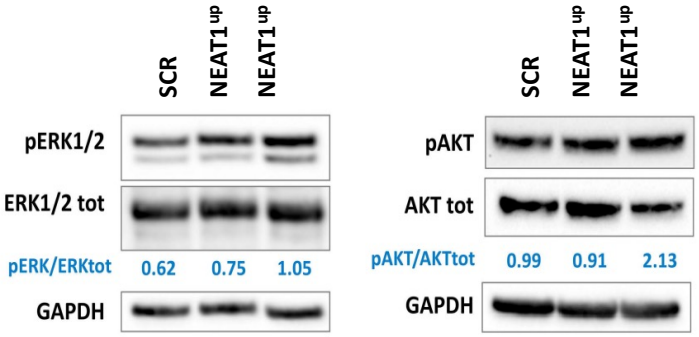
Taiana E, Neri A. et al., Manuscript in preparation

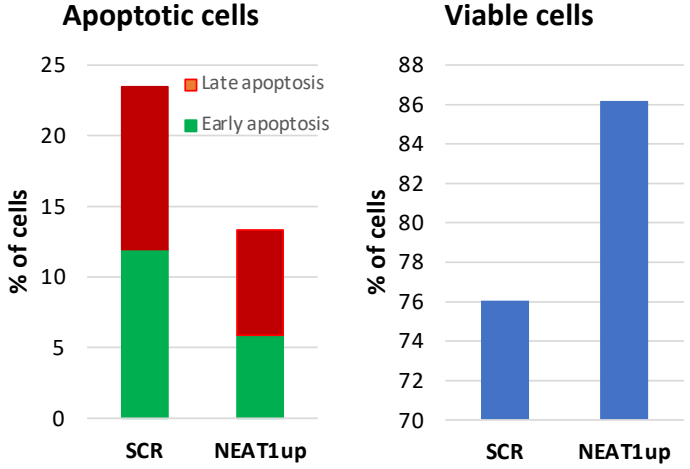
NEAT1 overexpression is crucial to **sustain the growth and the survival of MM cells** when maintained in serum starvation or hypoxia

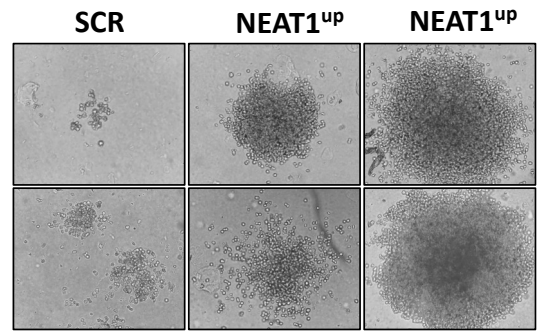










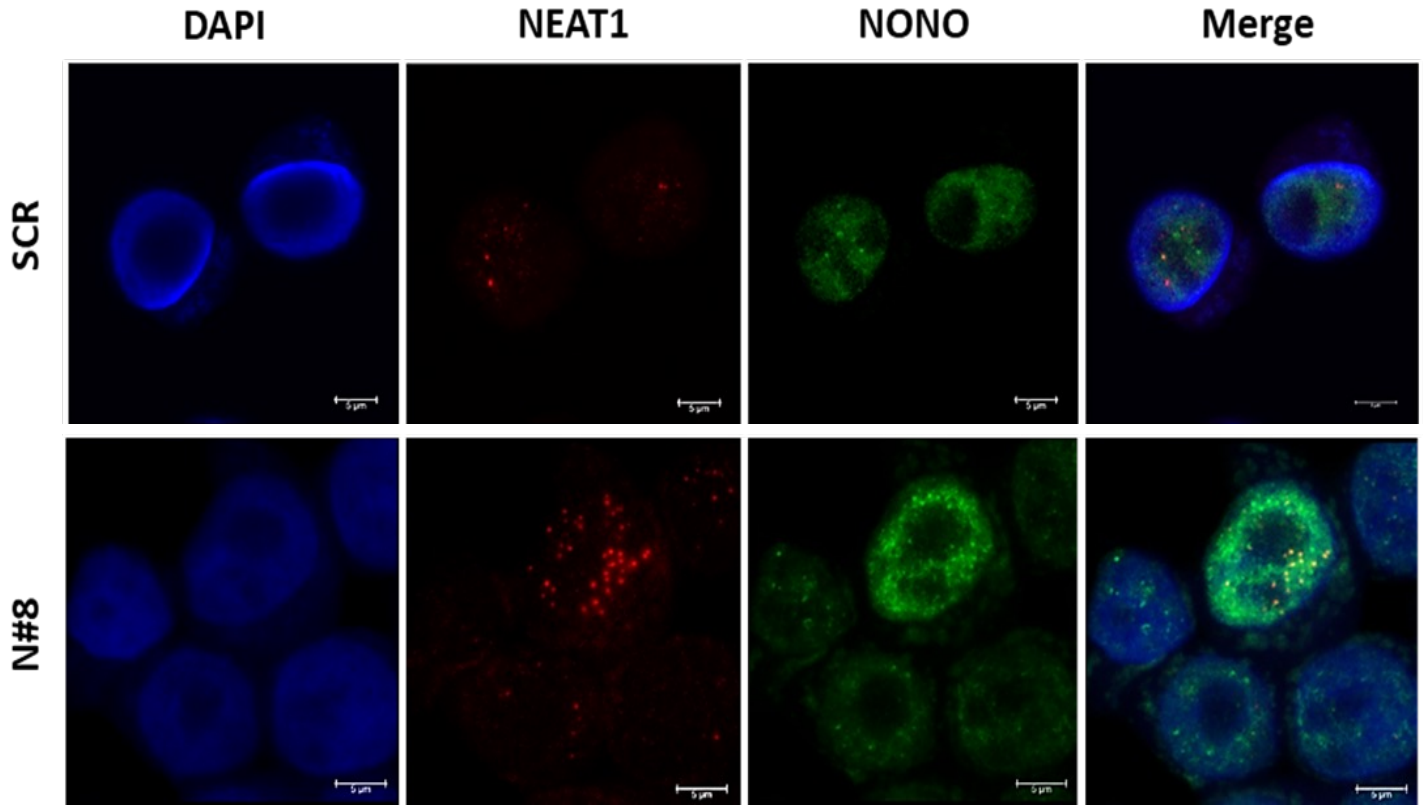


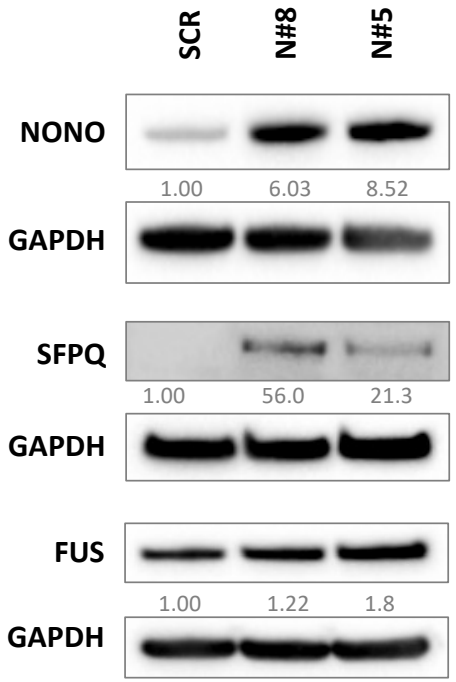
Taiana E. et al., Haematologica. 2023.

Taiana E. et al., Haematologica. 2023. PMID: 36073514

By means of a **CRISPR-Cas9 transactivating approach**, we demonstrated that NEAT1 is involved in the maintenance of the **genome integrity** supporting the **acquisition of a pro-survival** and **pro-oncogenic phenotype** by **MM cells** through:

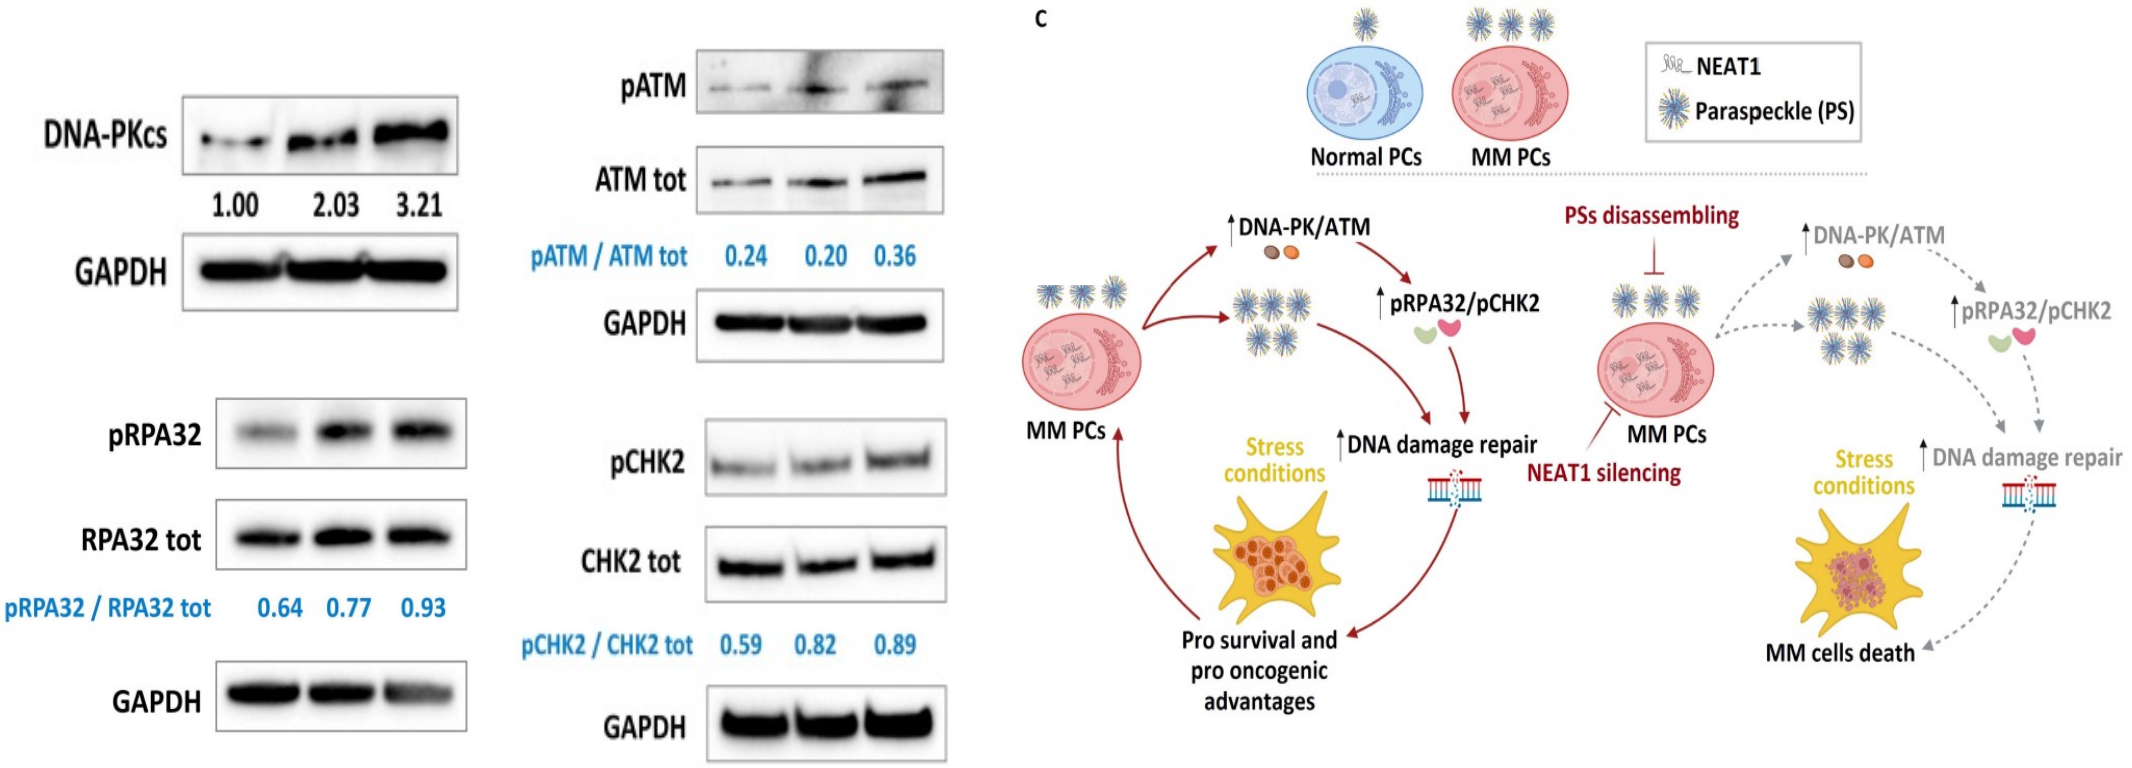
1. Increasing PSs and post-transcriptional stabilization of essential PS Proteins (NONO, SFPQ, FUS)





Taiana E. et al., Haematologica. 2023.

2. Positive regulation of the molecular axis involving **ATM** and **DNA-PKs** kinases and their direct targets **pRPA32 and pCHK2**



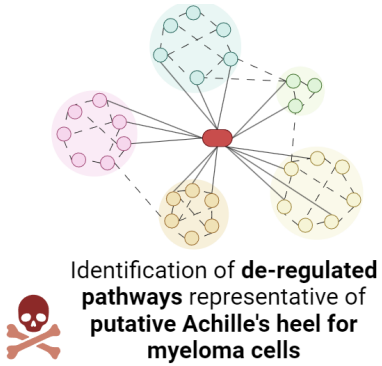
NEAT1 overexpression could be considered a generalized **rescue mechanism for MM plasma cells** strongly suggesting that **NEAT1 and PSs targeting** could be considered a novel promising strategy for **innovative anti-MM therapies**.

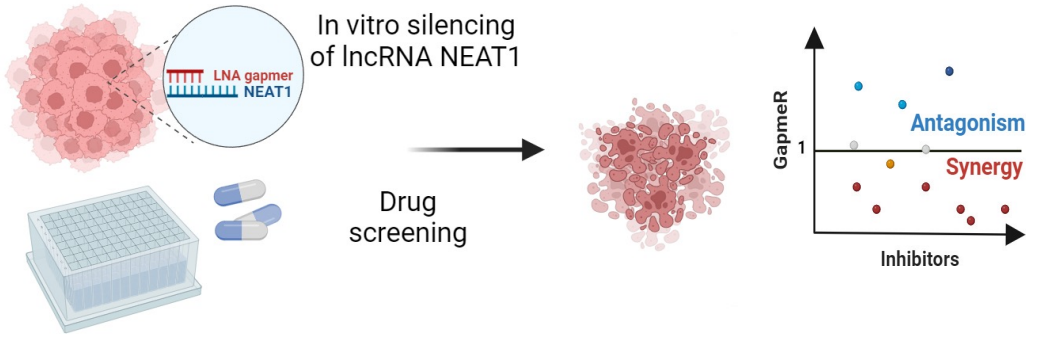
Taiana E. et al., Haematologica. 2023.

What's next?

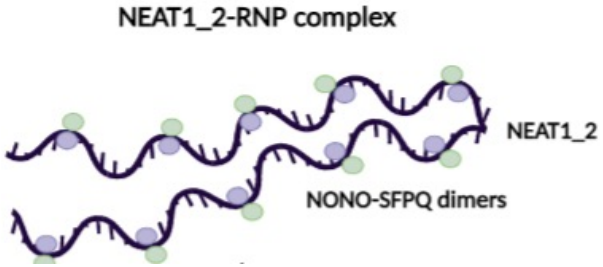
Given the **strong antiproliferative effect** observed upon **NEAT1 silencing** in MM cells we aim:

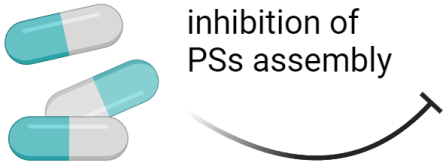
1. To provide novel insights concerning the potential effects that NEAT1 exerts on **gene expression** and its putative role in **chemo-resistant mechanisms,** priming the development of **novel combinatorial strategies in MM.**

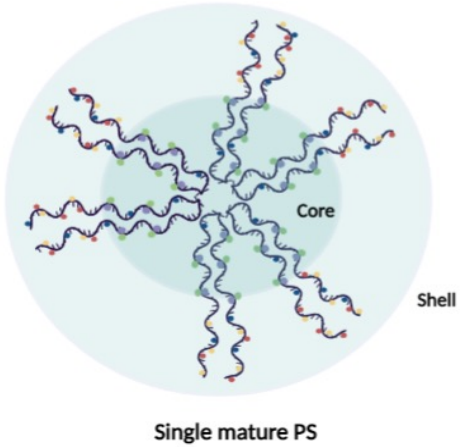




2. To identify possible chemical compounds able to **abrogate NEAT1-proteins and proteins-proteins interactions** considered to be essential for paraspeckle assembly and activity.







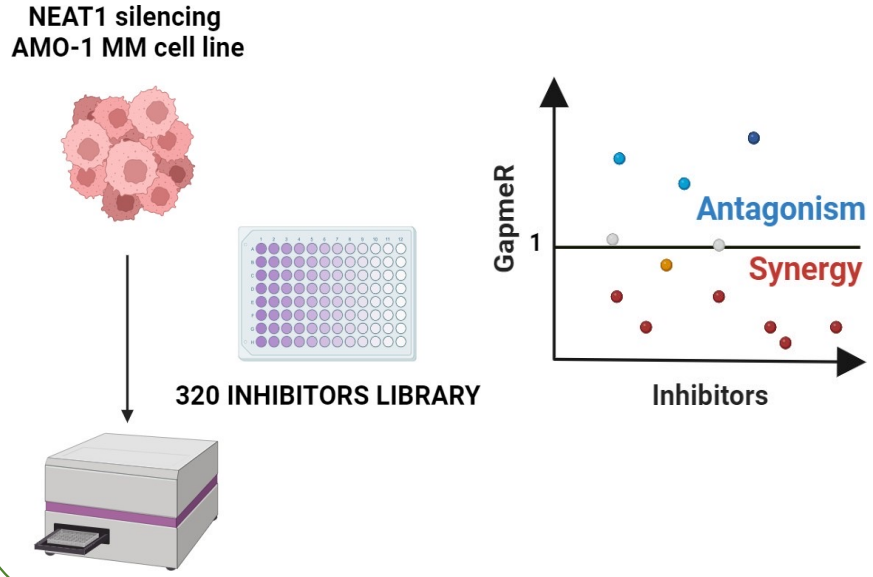
Schell, B., Legrand, P., & Fribourg, S. (2022). Crystal structure of SFPQ-NONO heterodimer. *Biochimie*, *198*, 1–7. Advance online publication.

Task 1

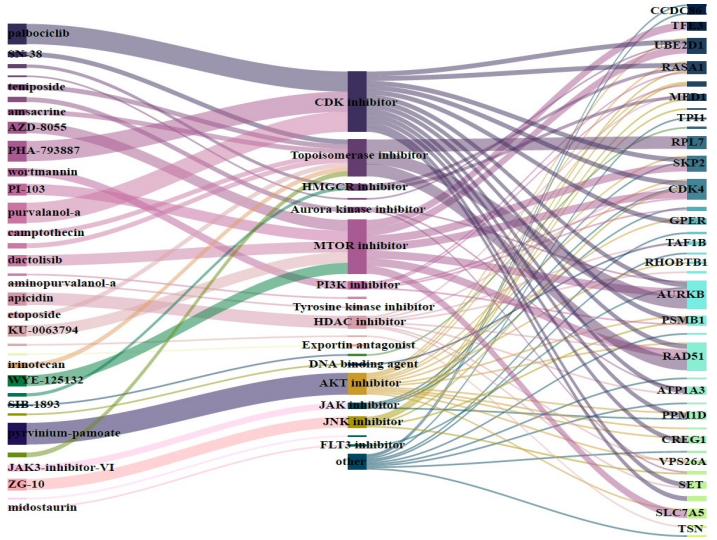
Identification of molecular targets having a synergistic effect in combination with NEAT1 silencing

NEAT1 silencing

In vitro high-throughput drug screening



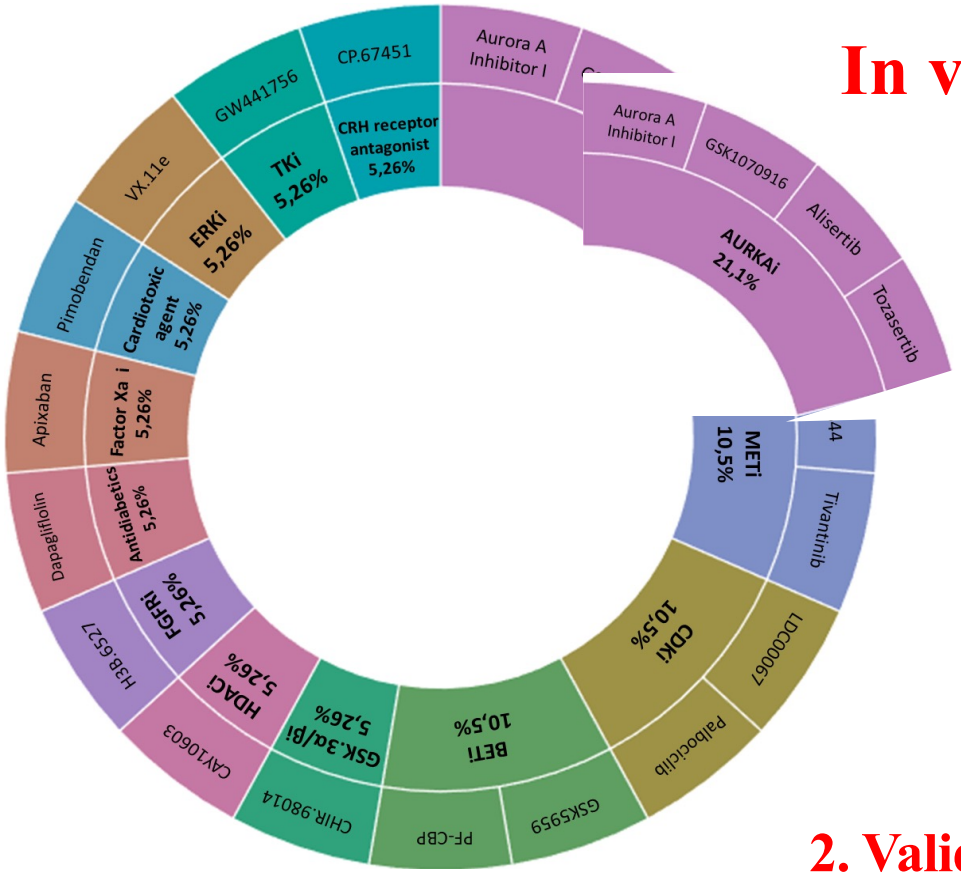
In silico drug identification



Unpublished. Please, do not post

Puccio N et al., Manuscript in preparation

In vitro highthroughput drug screening



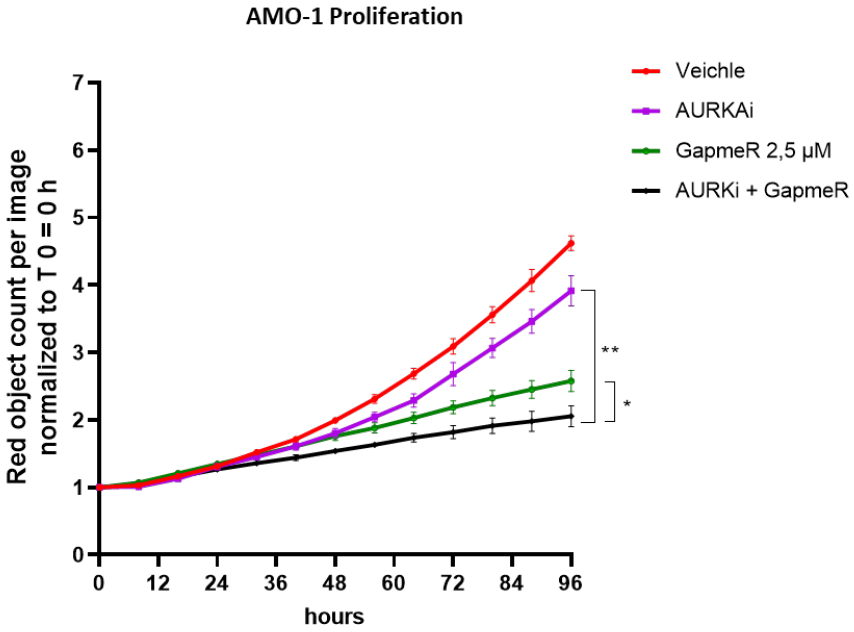
Puccio N et al., Manuscript in preparation

Unpublished. Please, do not post

19 compounds have a **synergistic effect** in combination with **NEAT1 silencing,** leading to a **decreased multiple myeloma cells viability**.

Aurora kinase inhibitors are the most promising compounds able to **individually exert a synergistic activity with NEAT1 silencing** in vitro

2. Validation phase on a panel of MM cell lines with Incucyte S3™

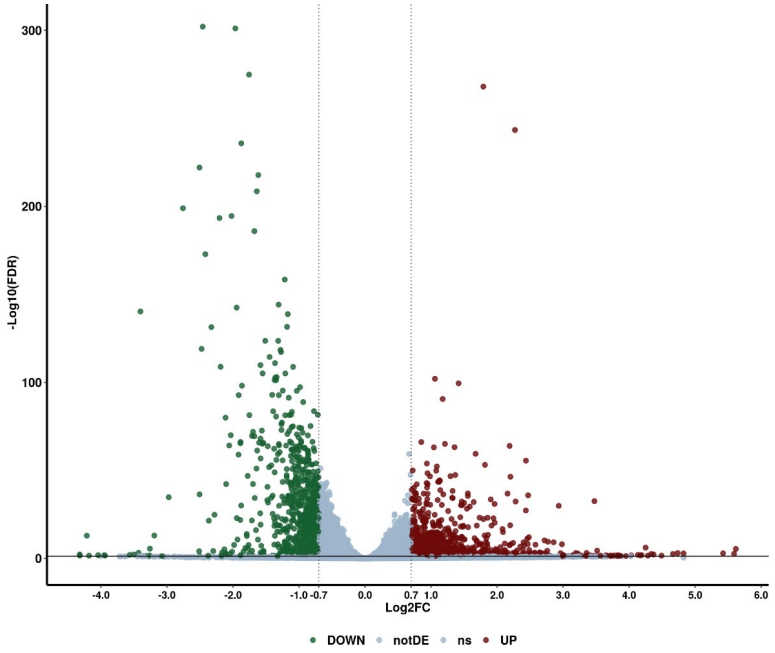


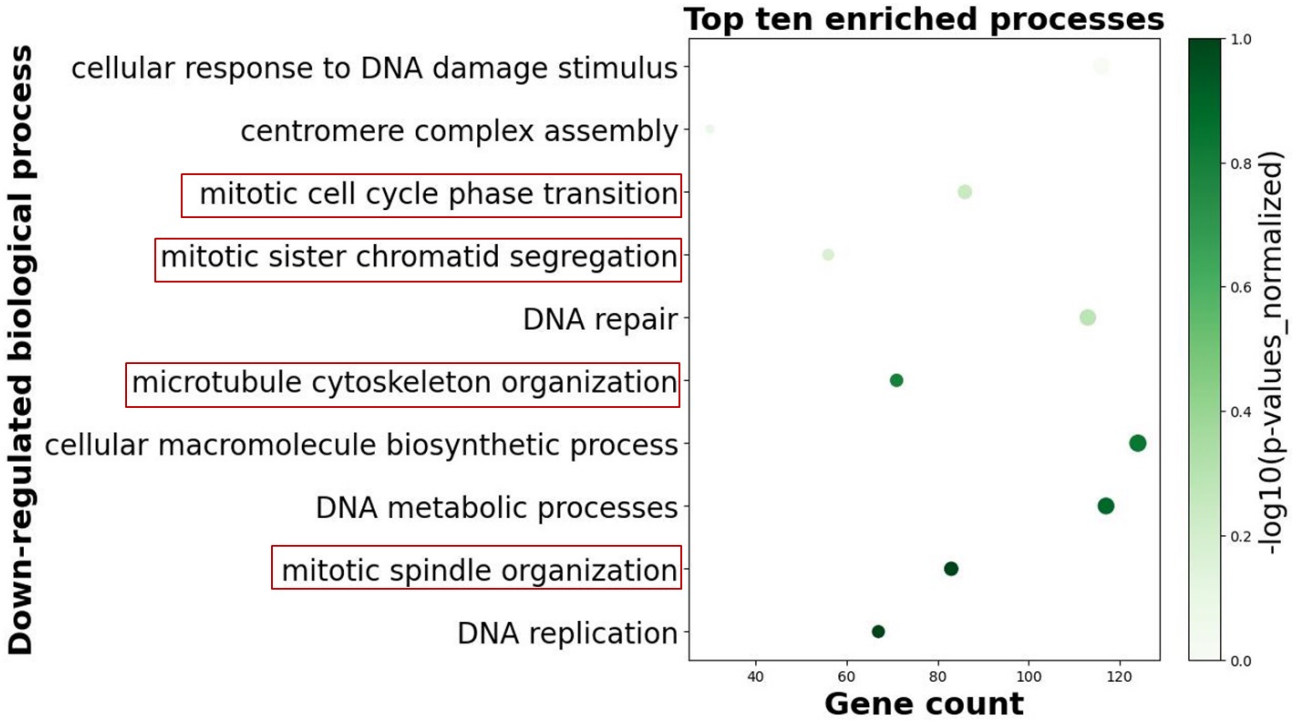
In silico drug identification approach

Transcriptome analysis by bulk RNA sequencing in **NEAT1 silenced AMO-1 MM cells and the relative control**

Identification of 752 down-regulated genes and 957 up-regulated genes **in NEAT1 silenced samples** compared to the control

Enrichment analysis





Unpublished. Please, do not post

Puccio N et al., Manuscript in preparation

Unpublished. Please, do not post

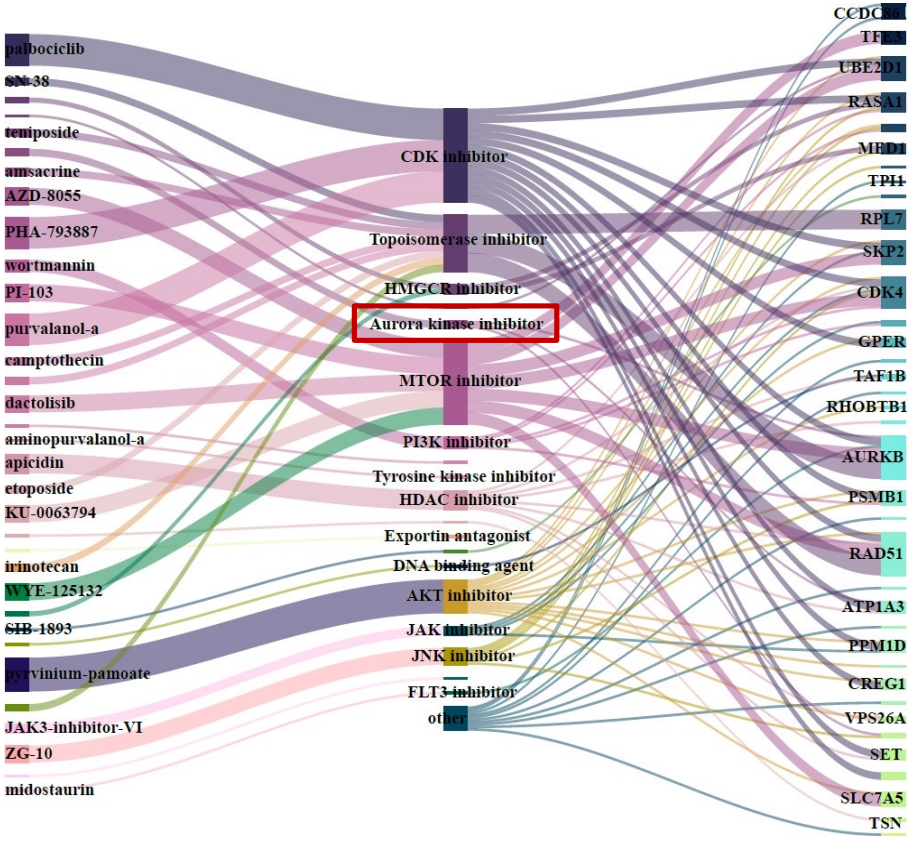
In silico drug identification approach

Transcriptome analysis by bulk RNA sequencing in **NEAT1 silenced AMO-1 MM cells and the relative control**

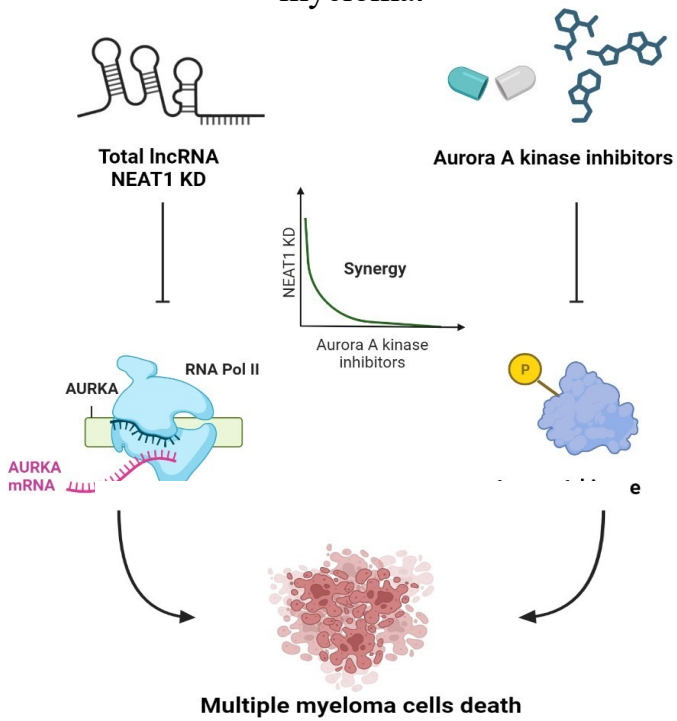
Identification of 752 down-regulated genes and 957 up-regulated genes **in NEAT1 silenced samples** compared to the control

ConnectivityMap

Compounds mimicking NEAT1 silencing signature were selected with the highest connectivity score



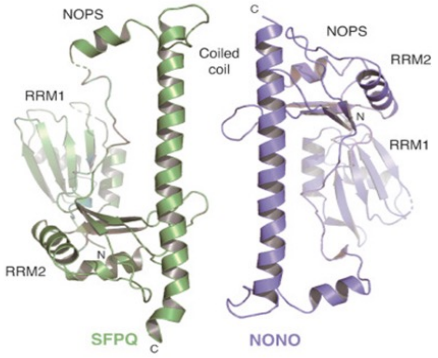
Both ***in silico*** and ***in vitro*** approaches identified **Aurora kinase inhibitors** as compounds able to **synergize with NEAT1 silencing**, suggesting that **this combination** could represent a **prominent therapeutic option** for multiple myeloma.

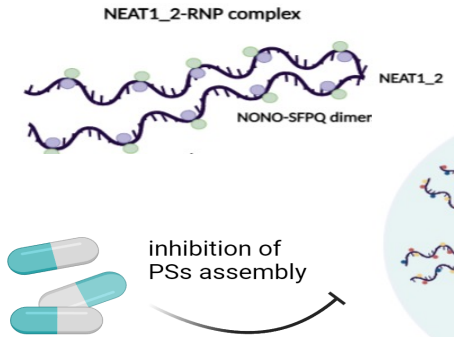


Identification of novel potential druggable vulnerabilities in MM

Task 2

NONO/SFPQ heterodimers and PSs structure





Discover Oncology

Ronchetti et al., 2022

Discover

Brief Communication

Expression levels of NONO, a nuclear protein primarily involved in paraspeckles function, are associated with several deregulated molecular pathways and poor clinical outcome in multiple myeloma

Domenica Ronchetti[1,2] · Vanessa Katia Favasuli[1,2] · Ilaria Silvestris[1,2] · Katia Todoerti[1,5] · Federica Torricelli[3] · Niccolò Bolli[1,2] · Alessia Ciarrocchi[3] · Elisa Taiana[1] · Antonino Neri[4]

Higher NONO levels were correlated with **poorer OS and PFS of MM patients**.

The combination of **higher NONO expression level with the occurrence of 1q-gain was associated with the poorest survival rate in OS and PFS.**
