Natura del problema

Emofilia acquisita A

Disordine coagulativo acquisito causato da anticorpi anti fattore VIII (inibitori)

Inibitori potenzialmente di tutti i fattori

Anticorpi IgG →interferenza FVIII – FX e FIXa oppure FVIII – fosfolipidi e FVW

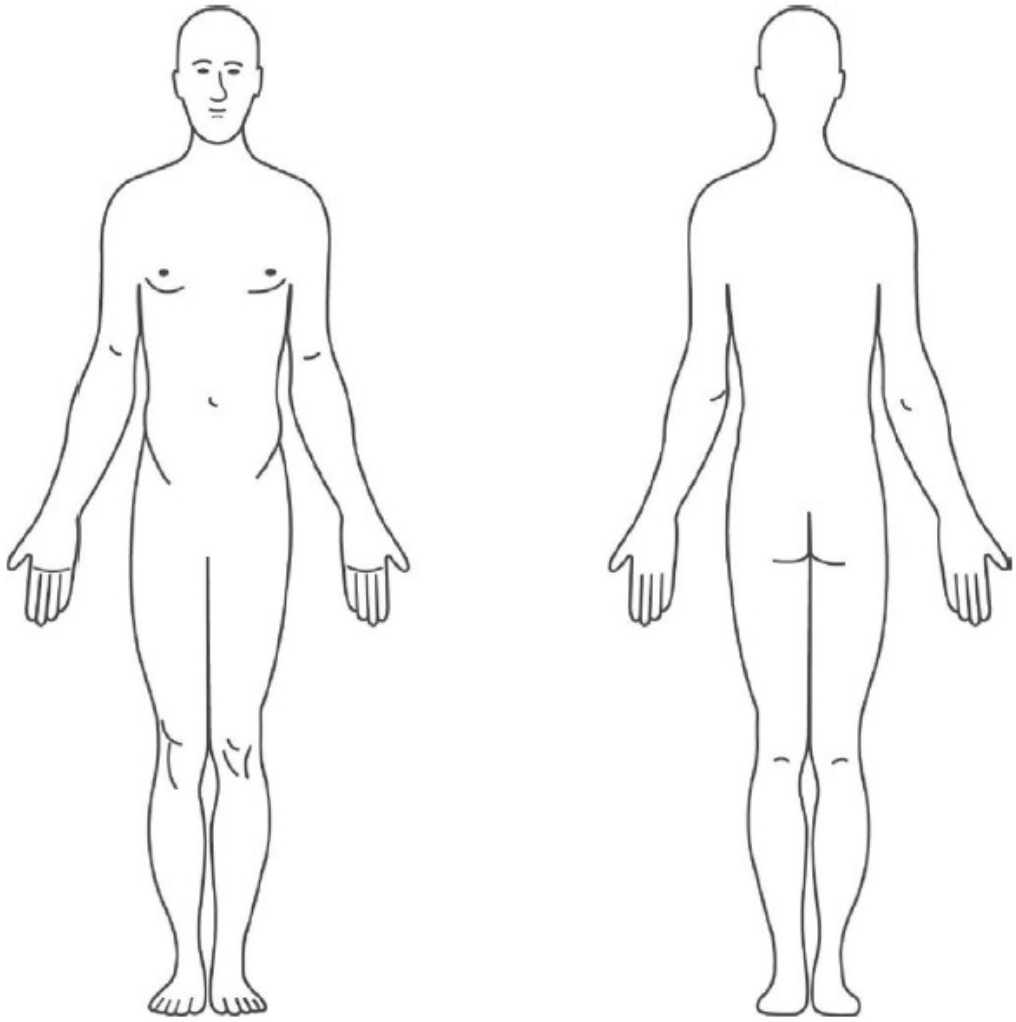
<u>Valutazione clinica</u>

- 80% dei pazienti emorragia significativa che richiede trasfusione
- Prestare attenzione agli arti (**DD con TVP**)
- Rapida progressione a **sindrome compartimentale**
- Monitoraggio serrato, compreso stato neurologico (**emorragia intracranica**)
- Limitare interventi invasivi

Menaka P Hematol Oncol Clin N Am 2021

Use of the body map involves the following steps:

1. Draw any bleeding on body map on admission
2. Draw around bleeds on patient skin to aid monitoring
3. Check patient every shift for new or extended bleeding
4. Report any new or extended bleeding to hemophilia team.



Diagnosi differenziale della AHA

- ❑ Disordini coagulativi ereditari (deficit/insufficienza fattori coagulazione)
- ❑ Emofilia A (carenza di FVIII) – X linked
- ❑ Emofilia B (carenza di FIX) – X linked
- ❑ Emofilia C (carenza di FXI) – autosomica recessiva
- ❑ von Willebrand disease (VWD)
- ❑ Lupus anticoagulant e eparine

Constantinescu C et al Blood rev 2022

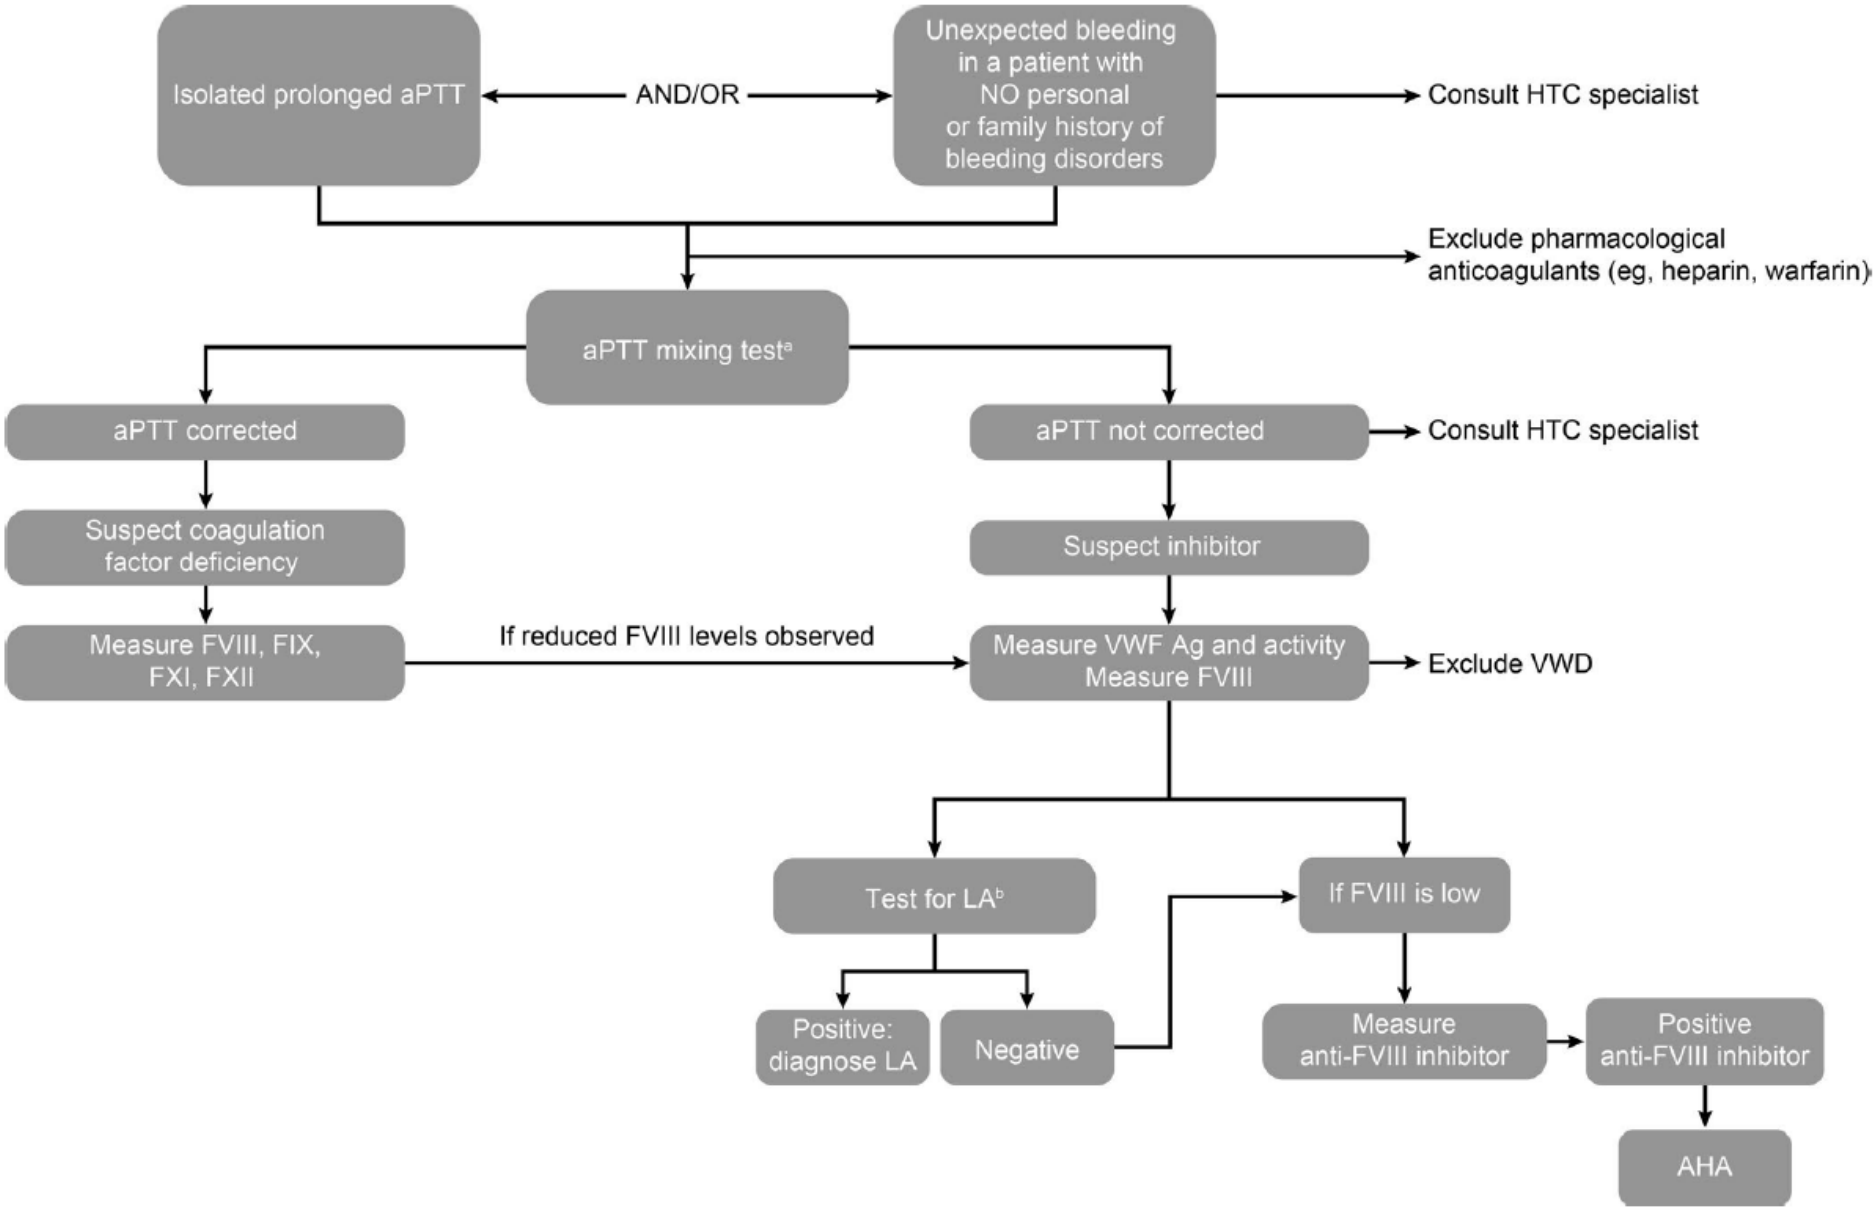

FIGURE 2 Key steps in diagnosing AHA. AHA, acquired hemophilia A; aPTT, activated partial thromboplastin time; FVIII, factor VIII; FIX, factor IX; FXI, factor XI; FXII, factor XII; HTC, hemophilia treatment center; LA, lupus anticoagulant; VWD, von Willebrand disease; VWF, von Willebrand factor

Strategie terapeutiche

1. Prevenire e trattare il sanguinamento

- Aumentare livelli di FVIII
- Bypassare FVIII per attivare la coagulazione

2. Eradicare l'inibitore

3. Trattare la patologia sottostante (se identificata)

Trattare il sanguinamento

- 70% pazienti necessita trattamento emostatico
- EACH2 registry: unico parametro significativo per il successo del trattamento è il **tempo**
- L'attività del FVIII e il titolo dell'inibitore non devono influenzare la decisione di iniziare il trattamento
- Qualsiasi trattamento emostatico è associato al rischio di eventi trombotici
- **Il trattamento emostatico deve essere prontamente iniziato in pazienti con sanguinamento clinicamente significativo**

Baudo F et al Blood 2012

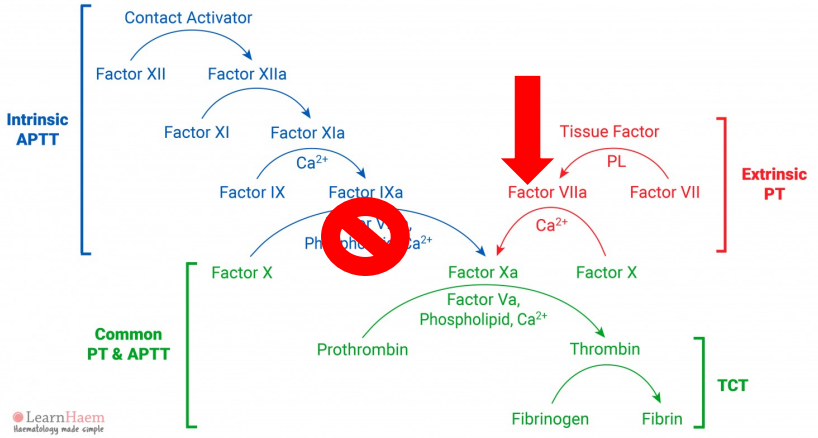
Knoebl P et al Journal of Thrombosis and Haemostasis 2012

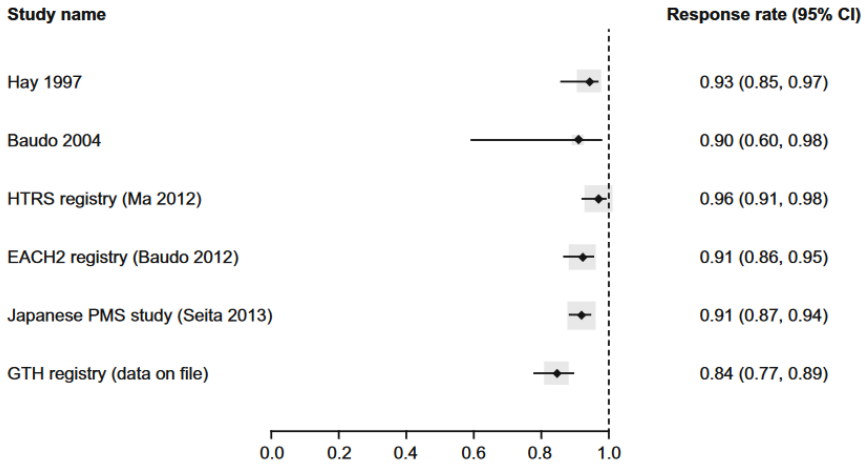
1. Prevenire e trattare il sanguinamento

Bypassare FVIII per attivare la coagulazione

Fattore VII attivato ricombinante umano (rFVIIa, eptacog alfa)

- Dati da review 12 studi, 671 pazienti e 1063 eventi emorragici
- Usato in prima linea in emorragie severe (39-90% dei casi)
- Efficacia >90% su controllo emostasi e livelli aPTT
- 8 su 12 studi riportano eventi trombotici 0-5% dei pazienti





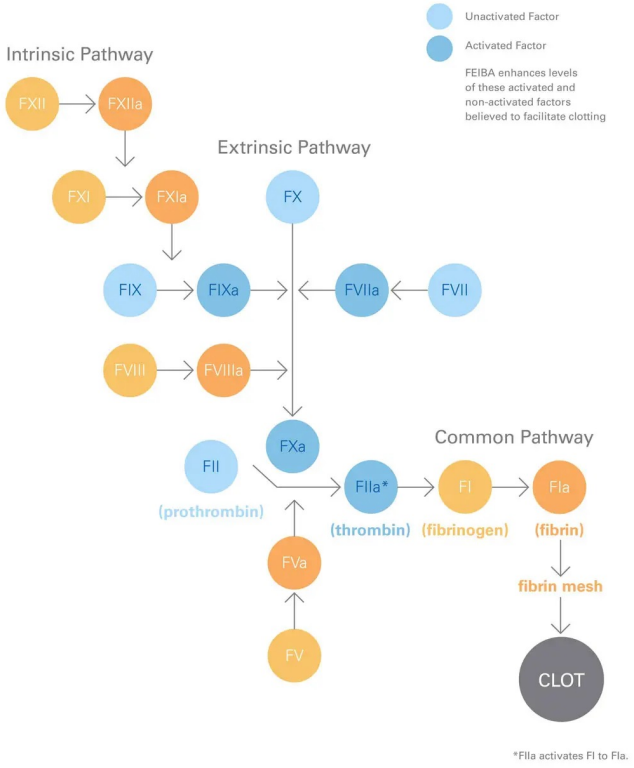
Tiede A et al Ann Hematol 2018

1. Prevenire e trattare il sanguinamento

Bypassare FVIII per attivare la coagulazione

APCC (activated prothrombin complex concentrate)

- Indicato in trattamento e prevenzione emorragia in pz con emofilia congenita
- Largo utilizzo in AHA
- Non dati da review sistematiche
- EACH2: Nessuna differenza in efficacia rispetto a rFVIIa
- >90% controllo emorragia se utilizzo in prima linea

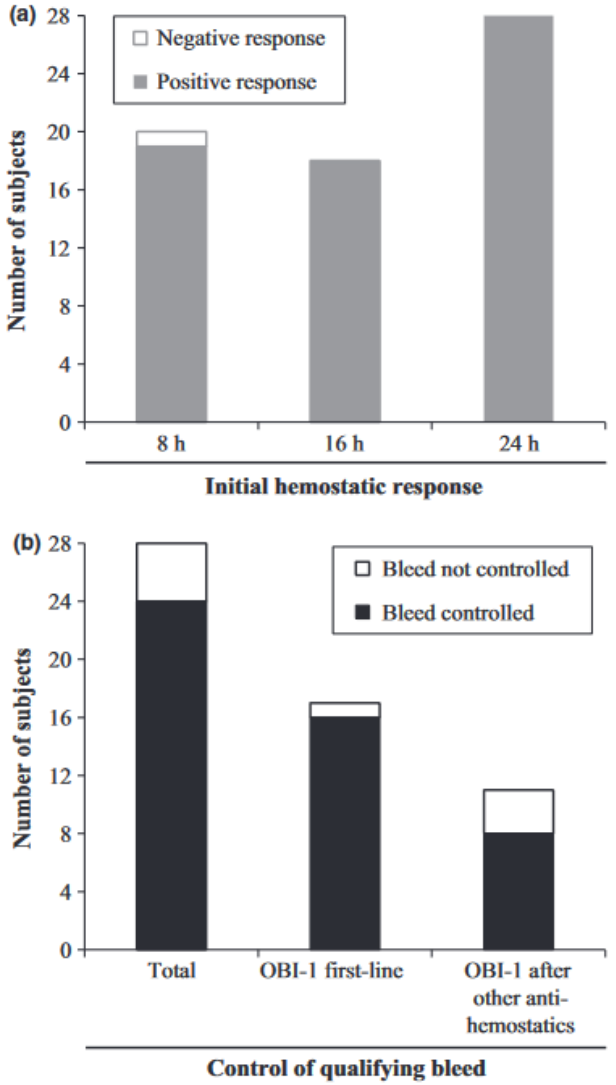


Baudo F et al Blood 2012
Dimichele D et al Haemophilia 2006

1. Prevenire e trattare il sanguinamento

Aumentare livelli di FVIII/replacement

- Terapia sostitutiva con **FVIII ricombinante porcino (rpFVIII)**
- Dosaggio inibitori rpFVIII sul pz
- Indicato se bassa attività autoanticorpi vs FVIII porcino
- Studio prospettico su 28 pz: emorragia controllata 86%
- Monitoraggio FVIII



Kruse-jarres et al Haemophilia 2015

1. Prevenire e trattare il sanguinamento

Aumentare livelli di FVIII

- Desmopressina (rilascio FVIII da cellule endoteliali)
- Fattore VIII ricombinante umano

Dati da registro EACH2:

- comparato con bypassing agents significativa minore efficacia emostatica (68% vs 93%)
- rischio di sovraccarico di fluidi, iponatriemia e scompenso cardiaco
- evitare in anziani
- Utilizzo solo se non disponibili agenti bypass

Tiede A et al Haematologica 2020

Hemostatic treatment

• We recommend that hemostatic treatment be initiated in patients with AHA and clinically relevant bleeding irrespective of inhibitor titer and residual FVIII activity.	1B
• We recommend the use of rFVIIa, APCC or rpFVIII instead of human FVIII concentrates or desmopressin for the treatment of clinically relevant bleeding in patients with AHA.	1B
• We recommend that alternative treatment strategies from among the first-line agents be used if appropriate initial treatment fails.	1C
• For initial treatment with rFVIIa, we recommend bolus injection of 90 μg/kg every 2–3 h until hemostasis is achieved.	1B
• For initial treatment with APCC, we recommend bolus injections of between 50–100 U/kg every 8–12 h, up to a maximum of 200 U/kg/day.	1B
• For initial treatment with rpFVIII, we recommend the approved dose of 200 U/kg, followed by further doses to maintain trough levels >50%.	1B
• We recommend close monitoring of FVIII activity during therapy with rpFVIII.	1B
• We suggest the use of recombinant or plasma-derived human FVIII concentrates only if bypassing agents or rpFVIII are unavailable or ineffective and the inhibitor titer is low. We recommend against the use of desmopressin.	1B
• We recommend the prophylactic use of bypassing agents or rpFVIII to cover minor or major invasive procedures.	1B

Tiede A et al Haematologica 2020

1. Prevenire e trattare il sanguinamento

Anti-fibrinolitici (acido tranexamico)

- Rischio trombotico con APCC e rFVII
- Utilizzo topico
- Eventi fatali riportati in associazione ad agenti bypassanti (rFVIIa)

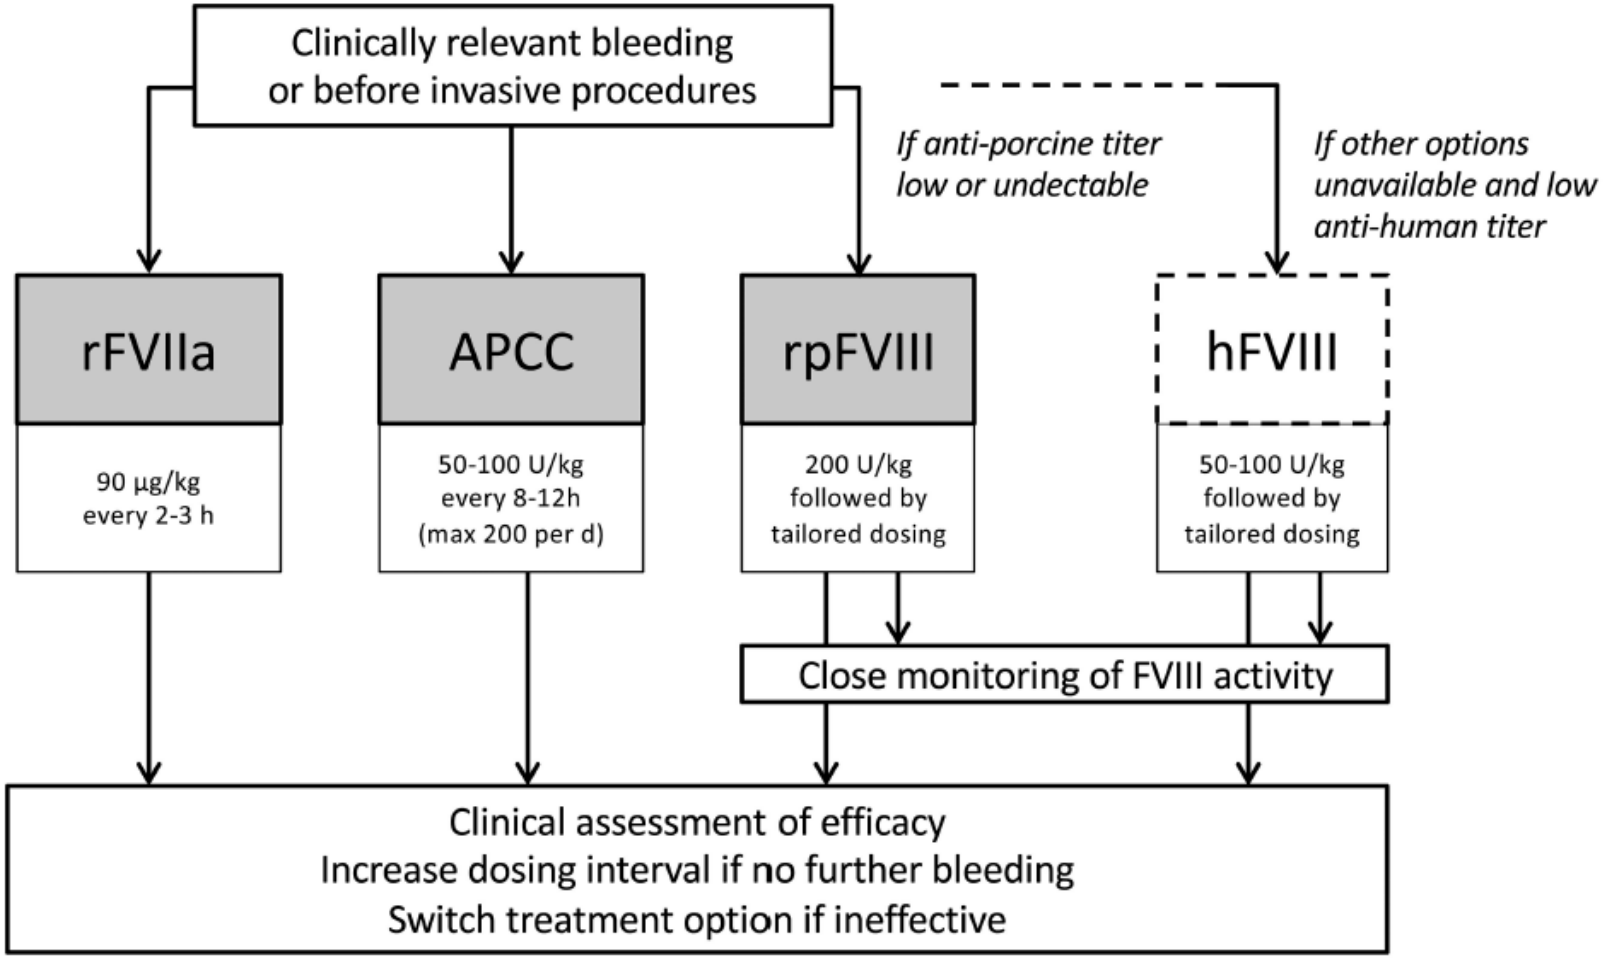

Figure 2. Choice and monitoring of hemostatic therapy in acquired hemophilia A. rFVIIa, recombinant activated factor VII (eptacog alfa); APCC, activated prothrombin complex concentrate; rpFVIII: recombinant porcine factor VIII (susoctocog alfa), hFVIII, human (plasma-derived or recombinant) factor VIII; h: hour; d: day.

Tiede A et al Haematologica 2020

First-Line Therapy	Recommended Dosage	PROS and CONS
Bypassing agents		
Activated Prothrombin Complex Concentrate	50–100 IU/kg every 8–12 h until hemostasis is obtained, then at longer intervals as required Maximum dose: 200 IU/kg daily	PROS Proven efficacy for clinical bleeding Easily available Usable also with the absence of a specialized laboratory. CONS No specific laboratory assay to monitor efficacy and the appropriateness of dosages. Possible thrombotic risk
Activated recombinant Factor VII	90–120 µg/kg every 2–3 h until hemostasis is obtained, then at longer intervals as required	PROS Proven efficacy for clinical bleeding Easily available Usable also with the absence of a specialized laboratory. CONS No specific laboratory assay to monitor efficacy and appropriateness of dosages. Possible thrombotic risk
Replacement therapy		
Recombinant porcine Factor VIII	200 IU/Kg as starting dose, subsequent doses according to the clinical response, Factor VIII levels and the type or severity of bleeding; generally, infusions every 4–12 h	PROS Can be monitored with a simple assay. It determines a measurable increase in Factor VIII levels. Documented clinical efficacy (studies still limited) No thromboembolic complications described. CONS Less effective in cases of presence and/or development of anti-porcine Factor VIII antibodies Availability of a laboratory around the clock to monitor Factor VIII levels
Second-line therapy		
Plasma-derived or recombinant factor VIII	Variable depending on severity of bleeding, inhibitor titter, infusion modalities (bolus or continuous infusion)	PROS It determines a measurable increase in factor VIII levels. Proven efficacy in patients with low inhibitor titer (<5 UB) Easily available Can be monitored with a simple assay. CONS Possible anamnestic response High dose required. Strict laboratory monitoring (daily)

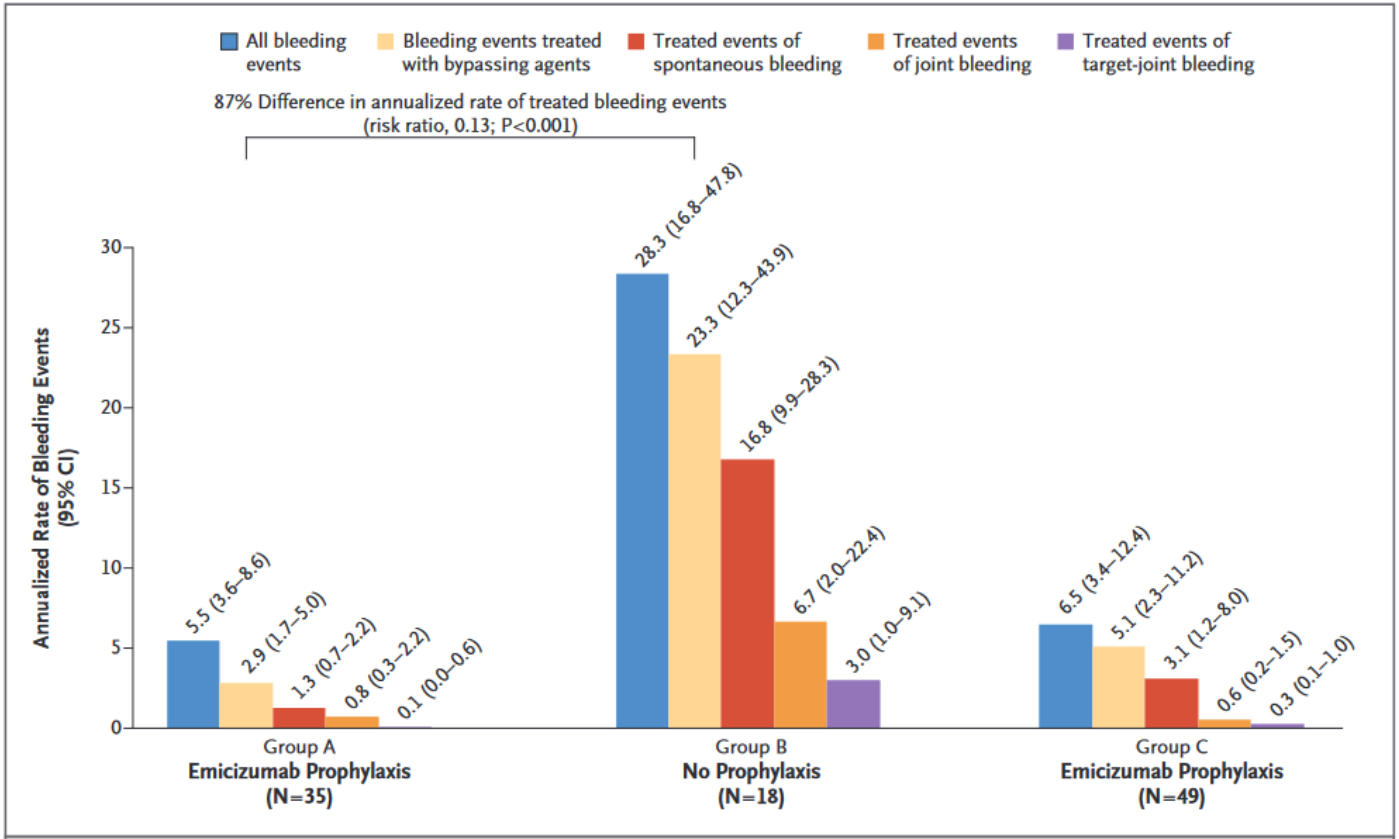

Figure 1. Annualized Bleeding Rate in Trial Groups A, B, and C.

The annualized bleeding rate was calculated with the use of a negative binomial-regression model. Participants in groups A and B had previously received episodic treatment with bypassing agents; participants in group C had previously received prophylaxis with bypassing agents. Group D was not included in the current analysis owing to the short follow-up at the time of data cutoff.

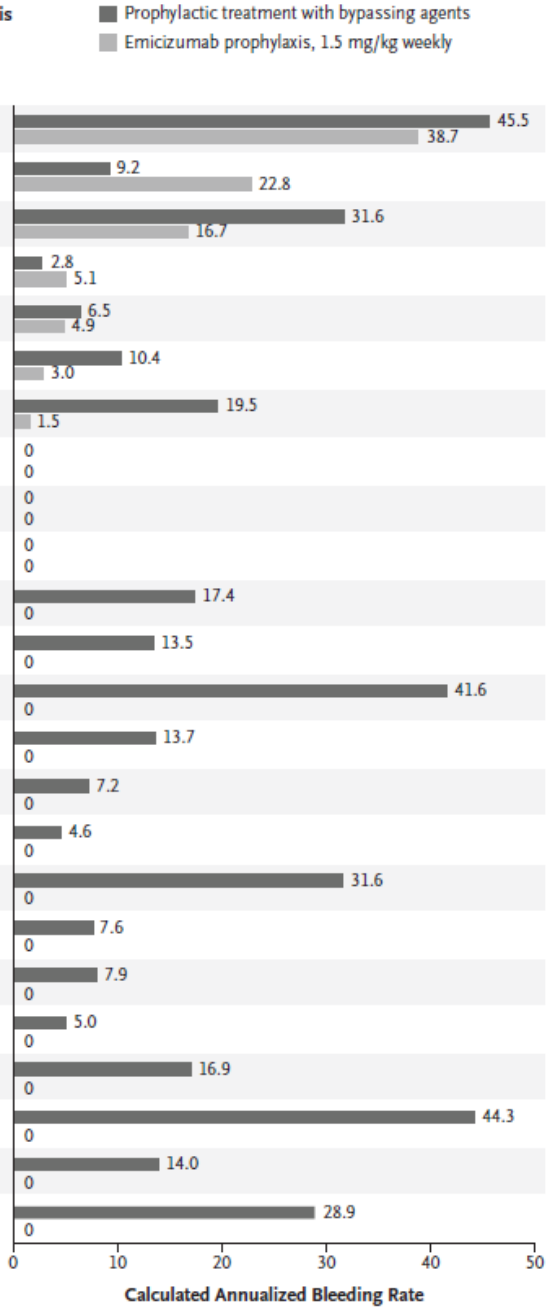

Figure 2. **Intraindividual Comparison of Treated Bleeding Events in Participants Receiving Emicizumab Prophylaxis (Group C) versus Previous Prophylactic Treatment with Bypassing Agents before Trial Entry.**

Oldenburg J et al A NEJM 2017

Emicizumab

- Il trattamento (inclusa la profilassi di routine) con agenti bypassanti deve essere interrotto il giorno prima di iniziare la terapia con emicizumab
- La profilassi con il fattore VIII (FVIII) può essere proseguita per i primi 7 giorni di trattamento con emicizumab
- La dose raccomandata è di 3 mg/kg una volta a settimana per le prime 4 settimane (dose di carico); a partire dalla settimana 5: dose di mantenimento pari a 1,5 mg/kg una volta a settimana (3 mg/kg ogni due settimane o 6 mg/kg ogni quattro settimane)

Hemlibra ® scheda tecnica

Strategie terapeutiche

2. Eradicare l'inibitore

- L'inibitore scompare spontaneamente in un terzo dei pz
- Necessaria terapia immunosoppressiva nella maggior parte
- No trial randomizzati di superiorità immunosoppressori

- **Prima scelta: corticosteroidi 1 mg/kg giorno**

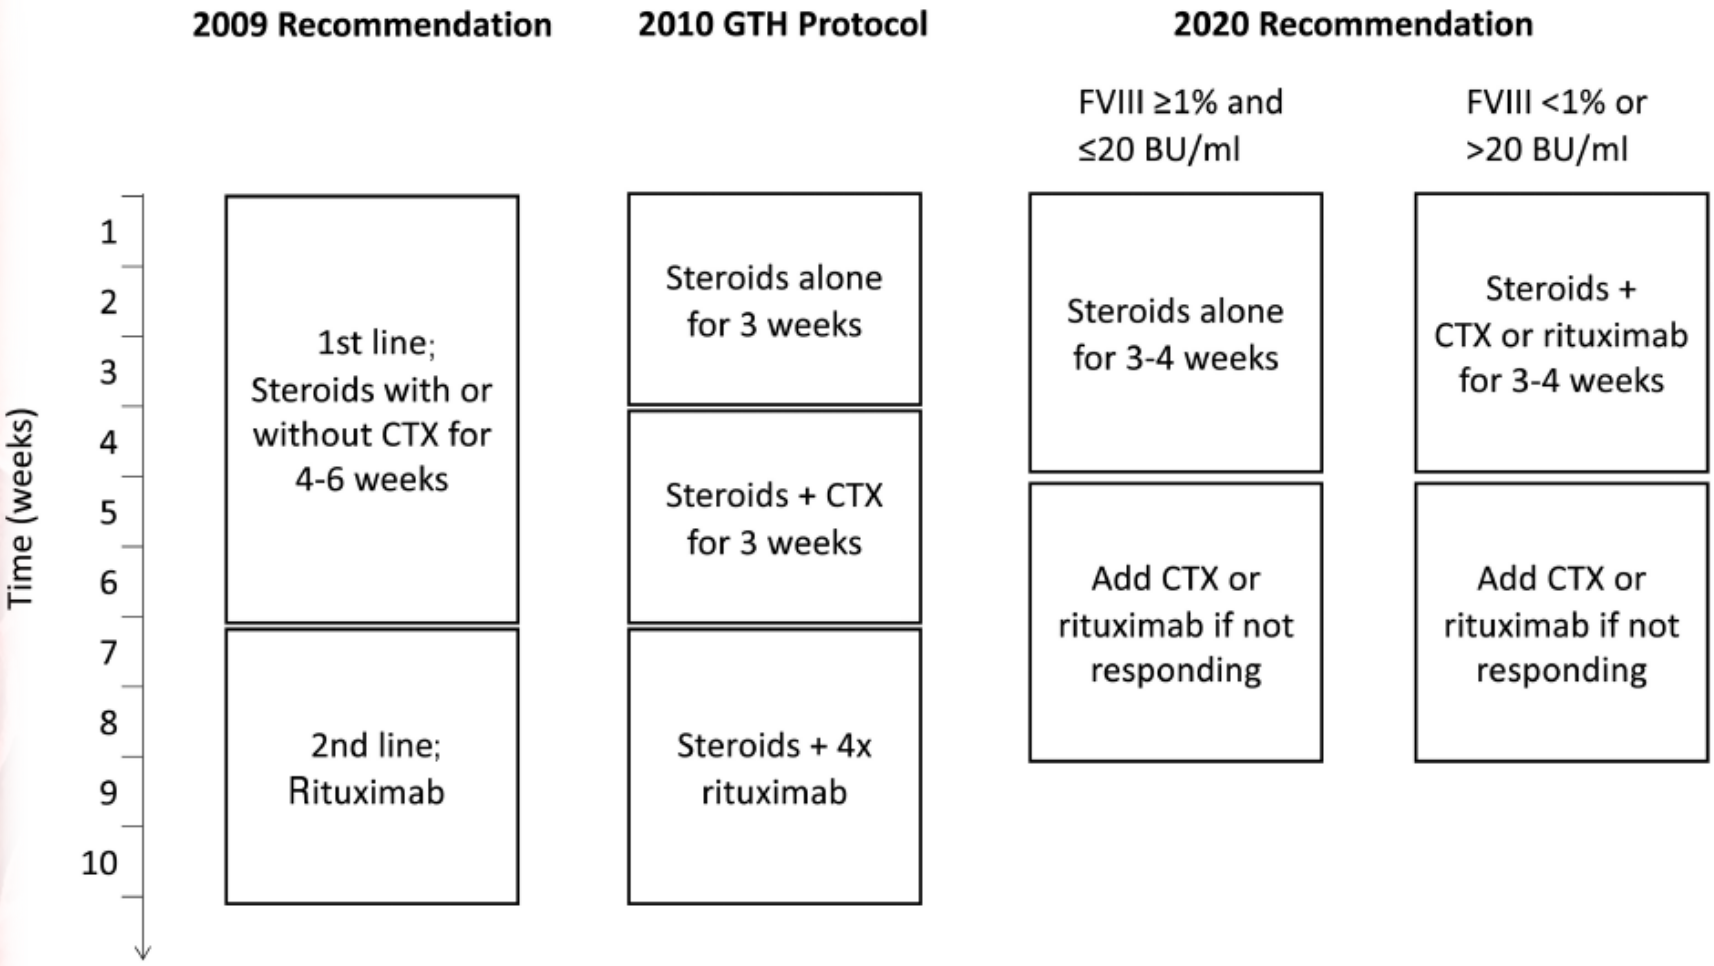
- Seconda scelta: rituxumab 375 mg/m2 q7 x 4
- Seconda scelta: ciclofosfamide 2 mg/kg giorno

- Regimi alternativi: plasmaferesi, azatioprina, vincristina, micofenolato, IgVena
- Protocolli combinati

Tiede A et al Haematologica 2020

Strategie terapeutiche

Eradicare l'inibitore



Tiede A et al Haematologica 2020

Gravidanza

- ✓ EACH2: 42 donne con AHA associate a gravidanza
- ✓ Risposta a terapia analoga a restante coorte
- ✓ Steroide 70% vs steroide + immunosoppressore 30%: non differenze significative
- ✓ Mortalità inferiore (effetto età)
- ✓ Attenzione a farmaci embriotossici

Knoebl P et al Journal of Thrombosis and Haemostasis 2012

Take home messages

- Sospettare in ogni paziente con emorragia e prolungamento isolato aPTT
- Tessuti molli, mucose, muscoli regioni maggiormente coinvolte
- Spesso emorragie di entità severa, mortalità non trascurabile
- 50% delle AHA sono sottese da patologia sottostante
- Test diagnostici: mixing test, attività FVIII e test FVIII inibitore (Bethesda)
- Strategie parallele: trattare sanguinamento ed eradicazione inibitore
